

PORTABLE GUARD TOWER

The Guard Tower is manufactured with four separate wall units that allow for quick and easy assembly on top of the standard Conex Box. Once placed on the Conex Box the Guard Tower will be approximately 12 feet in the air, giving the guards a greater view of the perimeter or area of threat. Once in position, the walls are filled from the top using sand as ballast. The sand filled walls provide the guards inside with 360 degrees of protection from 9mm, 5.56, and 7.62 threats. 12" dumps are provided for easy removal of the ballast allowing the Guard Tower to be repositioned as needed.

The overhead cover is 3/4" plywood on which lights, sensors, and antennae can be installed if desired. Access to the cover can be reached through a hatch type door that is pre-installed for convenience. The CBP Guard Tower eliminates the time and the mess associated with using sandbags. This product is a recoverable asset that can be broken down and deployed inside the Conex Box.
